Art Unit: 3767

DETAILED ACTION

Acknowledgments

- 1. This office action is in response to the reply filed on 3/3/2009.
- 2. In the reply, the Applicant amended claims 13, 18 and 21. Claims 19-20 were previously withdrawn.

Claim Rejections - 35 USC § 103

- 3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 4. Claims 13, 15-16, 21, 23-26 are rejected under 35 U.S.C. 103(a) as being unpatentable over Jackson (4623335) in view of Treu (5630935). Jackson discloses an apparatus for regulating pressure applied during a medical procedure, comprising: an inelastic housing (24) enclosing an inner volume, the housing having a first and second end (respective ends of syringe 24 and 26) wherein the housing (24) comprises a cylindrical inelastic housing enclosing the inner volume and a plunger (25); an aperture (18) in the housing for conveying pressure from the housing during medical procedure, and a pressure-operated valve (22; Fig 2) coupled between the inner volume of the housing and a space outside of the inner volume of the housing for allowing pressure to escape from the inner volume of the housing through the valve when pressure in the housing exceeds a threshold, whereby the valve releases pressure from within the inner

Application/Control Number: 10/751,765

Art Unit: 3767

volume of the housing (Figs 1-4; col 5, Ins 32-col 6, Ins 3); wherein the pressure operate valve comprises and opening (52), a plunger (60) disposed within the inner volume of the housing; a spring (52) disposed within the inner volume of the housing, wherein the spring is positioned between the second end of the housing and the plunger (Fig 2), wherein the plunger in a rest position is between the opening and the aperture (Fig 2). and wherein as fluid is inserted into the inner volume of the housing via the aperture, increased pressure within the inner volume of the housing moves the plunger toward the opening (Figs 1-4; col 5, Ins 32-col 6, Ins 3); wherein the opening is positioned in a side of the housing providing access to the inner volume of the housing (52: Fig 2). wherein at normal pressure the opening is closer to the second end than the plunger and wherein as pressure within the inner volume of the housing increases so as to move the plunger past the opening (Figs 1-4), the pressure within the inner housing is released through the opening (Figs 1-4; col 5, Ins 32-col 6, Ins 3); wherein the threshold is set by a spring exerting a force which must be overcome to exceed the threshold (Figs 1-4; col 5, lns 32-col 6, lns 3).

Page 3

5. However, Jackson does not disclose that the pressure operated valve is adapted to allow selection of the threshold, during use, from a plurality of different pre-set thresholds; wherein a movable member which can be positioned between at least two different positions corresponding to different forces of the spring which must be overcome to exceed the threshold. Treu teaches that it is known to have a pressure operated valve adapted to allow selection of the threshold during use from a plurality of different thresholds (130; 144; col 9, lns 56-67; wherein the user controls the force and

Art Unit: 3767

thus the threshold via the adjustment member) and a movable member (140) which can be positioned between at least two different positions corresponding to different forces of the spring which must be overcome to exceed the threshold (col 9, lns 56-67) for the purpose of controlling the threshold value. It would have been obvious to one having ordinary skill in the art at the time the invention was made to modify the spring system as taught by Jackson with the spring system adapted to allow selection of the threshold as taught by Treu for the purpose of controlling the threshold valve.

Response to Arguments

- 6. Applicant's arguments filed 3/3/2009 have been fully considered but they are not persuasive.
- 7. The Applicant argues that Jackson in view of Treu does not disclose pressure relief valve operated by fluid pressure from the interior or the syringe or discrete threshold pressure selection by a user.
- 8. In response to applicant's argument, the Examiner notes that "pre-set" is defined as "to set in advance" by Webster's dictionary. So the claim requires a plurality of thresholds set in advance. The device of Treu has an adjustment member (130) that screws clockwise or counterclockwise relative to housing (153) to thereby adjust the force that the pressure relief spring (144) applies to the plastic plunger (142) and elastomeric diaphragm (140). This adjustment changes the threshold level for pressure relief during use. The Examiner contends that the selection of the spring and selection of the range the adjustment member can be rotated to adjust the force of the spring constitutes a plurality of discrete pre-set thresholds. Before use, due to the selection of

Art Unit: 3767

the spring and properties of the adjustment member, the device of Treu has a plurality of available thresholds that the user can set the device to during use. A user could select a discrete threshold by one full rotation of the adjustment member will always produce a discrete threshold, a second full rotation of the member will always produce a second discrete threshold, etc...).

9. Jackson in view of Treu does teach a pressure relief valve operated by fluid pressure. The modification of Jackson by Treu replaces the spring system (52') shown in Fig 4, with the spring (144) and adjustment member (130) of Treu. Jackson is clearly shown as being responsive to fluid pressure.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to ANDREW M. GILBERT whose telephone number is (571)272-7216. The examiner can normally be reached on 8:30 am to 5:00 pm Monday through Friday.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Kevin Sirmons can be reached on (571)272-4965. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
